

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A method for processing a spread spectrum baseband signal, comprising:

despreading samples of the baseband signal with two or more instances of a spreading code, the instances of the spreading code successively offset relative to the signal samples, to provide two or more despread results; and

~~after completion of the despreading, interpolating the two or more despread results based on a previously estimated finger location to provide a symbol estimate, wherein interpolating the two or more despread results includes selecting the despread results around the previously estimated finger location and selecting interpolation coefficients based on the previously estimated finger location~~

selecting, from the two or more despread results, despread results near a previously estimated finger location;

selecting interpolation coefficients based on the previously estimated finger location; and
performing interpolation using the selected despread results and the selected interpolation coefficients to provide an estimated symbol value at the previously estimated finger location,
wherein selecting despread results, selecting interpolation coefficients and performing interpolation are performed after completion of the despreading.

2. (Original) A method as defined in claim 1, wherein the samples of the baseband signal are oversampled at two to four times a chip rate.

3. (Currently amended) A method as defined in claim 2, wherein the step of ~~interpolating the two or more despread results~~ performing interpolation produces an effective sampling of the baseband signal at eight times the chip rate.

4-5. (Cancelled)

6. (Currently amended) A method as defined in claim 1, wherein the step of ~~interpolating the two or more despread results~~ performing interpolation comprises multiplying the selected despread results by respective selected interpolation coefficients to provide intermediate values and summing the intermediate values to provide the symbol estimate.
7. (Currently amended) A method as defined in claim 1, wherein the step of ~~interpolating the two or more despread results~~ performing interpolation is repeated at a symbol rate.
8. (Original) A method as defined in claim 1, wherein despreading samples of the baseband signal comprises multiplying the samples by respective code elements to provide intermediate values and accumulating the intermediate values to provide a despread result.
9. (Original) A method as defined in claim 1, wherein successive instances of the spreading code are offset by one half chip relative to the signal samples.
10. (Currently amended) A method as defined in claim 1, wherein the steps of despreading samples of the baseband signal and ~~interpolating the two or more despread results~~ performing interpolation are performed by a programmable digital signal processor.
11. (Original) A method as defined in claim 10, wherein the step of despreading samples of the baseband signal comprises performing a plurality of despreading operations simultaneously.
12. (Currently amended) A method as defined in claim 1, wherein ~~interpolating the two or more despread results~~ performing interpolation comprises:
interpolating the two or more despread results performing interpolation using interpolation coefficients corresponding to the estimated finger location,

~~interpolating the two or more despread results performing interpolation using~~
interpolation coefficients corresponding to a time earlier than the estimated finger location, and
~~interpolating the two or more despread results performing interpolation using~~
interpolation coefficients corresponding to a time later than the estimated finger location.

13. (Currently amended) Apparatus for processing a spread spectrum baseband signal, comprising:

means for despread samples of the baseband signal with two or more instances of a spreading code, the instances of the spreading code successively offset relative to the signal samples, to provide two or more despread results; and

~~means for interpolating the two or more despread results based on a previously estimated finger location to provide a symbol estimate, wherein the interpolating is performed after completion of the desreading and wherein the means for interpolating the two or more despread results includes means for selecting the despread results around the previously estimated finger location and means for selecting interpolation coefficients based on the previously estimated finger location~~

means for selecting, from the two or more despread results, despread results near a previously estimated finger location;

means for selecting interpolation coefficients based on the previously estimated finger location; and

means for performing interpolation using the selected despread results and the selected interpolation coefficients to provide an estimated symbol value at the previously estimated finger location, wherein selecting despread results, selecting interpolation coefficients and performing interpolation are performed after completion of the desreading.

14. (Original) Apparatus as defined in claim 13, wherein the samples of the baseband signal are oversampled at two to four times a chip rate.

15. (Currently amended) Apparatus as defined in claim 14, wherein the means for ~~interpolating the two or more despread results~~ performing interpolation performs an effective sampling of the baseband signal at eight times the chip rate.

16-17. (Cancelled)

18. (Currently amended) Apparatus as defined in claim 13, wherein the means for ~~interpolating the two or more despread results~~ performing interpolation comprises means for multiplying the selected despread results by respective selected interpolation coefficients to provide intermediate values and means for summing the intermediate values to provide the symbol estimate.

19. (Currently amended) Apparatus as defined in claim 13, wherein the means for ~~interpolating the two or more despread results~~ performing interpolation operates at a symbol rate.

20. (Original) Apparatus as defined in claim 13, wherein the means for despread samples of the baseband signal comprises means for multiplying the samples by respective code elements to provide intermediate values and means for accumulating the intermediate values to provide a despread result.

21. (Original) Apparatus as defined in claim 13, wherein successive instances of the spreading code are offset by one half chip relative to the signal samples.

22. (Currently amended) Apparatus as defined in claim 13, wherein the means for despread and the means for ~~interpolating~~ performing interpolation are implemented by a programmable digital signal processor.

23. (Original) Apparatus as defined in claim 22, wherein the means for despreading samples of the baseband signal comprises means for performing a plurality of despreading operations simultaneously.

24. (Currently amended) Apparatus for processing a spread spectrum baseband signal, comprising:

a digital signal processor including a memory for holding instructions and data, a program sequencer for controlling execution of an instruction sequence and at least one computation block for executing the instruction sequence, said computation block including means ~~a circuit~~ for despreading samples of the baseband signal with two or more instances of a spreading code, the instances of the spreading code successively offset relative to the signal samples, to provide two or more despread results, ~~and means for interpolating the two or more despread results based on a previously estimated finger location to provide a symbol estimate, wherein the interpolating is performed after completion of the despreading and wherein the means for interpolating the two or more despread results includes means for selecting the despread results around the previously estimated finger location and means for selecting interpolation coefficients based on the previously estimated finger location~~ a circuit for selecting, from the two or more despread results, despread results near a previously estimated finger location, a circuit for selecting interpolation coefficients based on the previously estimated finger location, and a circuit for performing interpolation using the selected despread results and the selected interpolation coefficients to provide an estimated symbol value at the previously estimated finger location, wherein selecting despread results, selecting interpolation coefficients and performing interpolation are performed after completion of the despreading.
